**Minimal maintenance thanks to smart technology**

## OneOffixx architecture

**OneOffixx is based on the reliable client server architecture via web services. Our application will make sure the data is automatically synchronized and is stored on your machine so you can work even offline and stay up to date if the server has a newer version available. Users will only get templates, forms and other content they need based on organization or access rules. Besides the rich client we also offer a modern web application, which can be used with any browser and shared across your intranet.**

<b>Intelligent template distribution</b>	A browser-based interface that makes it possible to obtain documents and share templates across your intranet has been integrated.
<b>Authorization concept</b>	OneOffixx distinguishes between various roles such as system, template or campaign administrators, and organizational units. This makes it very easy to allocate various tasks.
<b>Macro-free zone</b>	OneOffixx uses modern OpenXML APIs to create and modify documents and templates instead of vulnerable VBA macros. This makes it very easy to share and collaborate on templates and documents in a safe environment..
<b>Low-redundancy templates</b>	Layout style sheets and template hierarchies prevent redundancies and thus considerably reduce the effort required for applying changes.
<b>Low-redundancy organizational data</b>	Company master data can be displayed as a hierarchy and with inheritance. This facilitates low-redundancy master data management and significantly reduces maintenance. The data also contains images such as logos, etc.
<b>SharePoint integration</b>	OneOffixx is ready for SharePoint 2010 and SharePoint 2013. Users can select and start templates directly in SharePoint. This is also possible for clients that have not installed OneOffixx.
<b>Third-party application integration</b>	OneOffixx has various integration levels. The first, and simplest, level guarantees that the Office AddIn properly co-exists with other third-party AddIns. At the second level, users can obtain data such as address details from another data source and integrate them in their documents directly in OneOffixx. At the third level, third-party applications can start OneOffixx remotely and instruct it to create a document and to integrate the transferred data. OneOffixx provides the free and open oDoc interface ( <a href="http://www.odoci.org">www.odoci.org</a> ) for this purpose. The interface may also be adjusted directly at the existing third-party application interface.
<b>Multi-tenant capability</b>	OneOffixx supports multiple tenants, making it easy to organize data to suit specific requirements. You can use this feature to separate production, integration, and test environments or to split data based on organization rules.
<b>Import / export</b>	Templates can be easily exported and/or imported, including all configuration and master templates required.
<b>Easy backup</b>	A copy of the complete database can be easily created in the administration view.
<b>Easy migration</b>	The documents created do not contain any references to paths and servers that may not be available in the future, thus making it difficult to open a document. You will not have any unwelcome surprises when opening documents several years later when the original template may long have been deleted or migrated to another server.
<b>Ready for the Cloud</b>	The OneOffixx server has been certified by «Azure» and can be leased as a service. The OneOffixx server may also be operated in customers' own infrastructure. It is very easy to migrate between the service host and your own host.
<b>Template-based printer control</b>	OneOffixx supports users in finding an ideal printer and printer tray. OneOffixx suggests the correct printer and printer tray for the printing process of each document.
